General view

Before placing the container on the foundation, place 4x metal support spacers (400x400x15 mm) on the right position according to distances shown in the top view.

Note:

- The proposed foundation solution is indicative only.
- To ensure proper installation, it is necessary to entrust the soil and foundation study to civil engineers.
- Depending on the soil type, the foundations may also be engineered differently, such as using pillars or poured concrete.
- Whatever solution is used, it must guarantee a perfectly flat support for the system.
- The foundation is recommended installed 300mm above the ground level.
